CONTRIBUTING FACTORS TO STREET DETERIORATION

- Decades of minimal and inconsistent investment in street resurfacing and street reconstruction
- Damage from storm water runoff and drainage systems – water penetrating pavement deteriorates the road base and subgrade
- Impact of permitted and illegal pavement cuts
- Increase in development, leading to larger traffic volumes than they were constructed to support
- Urban sprawl and development

PCI – What is it?

- Pavement Condition Index (PCI) is data used to assess the general condition of pavement.
- It is a numerical indicator that rates the general condition of the surface pavement of a road from 0-100.
 - New streets = 100; very poor < 30</p>
 - Currently at average 65
- The data can be used as a tool for decision-making on infrastructure improvements.
- Provides forecasting, which can assist with planning future improvements.
- The City reevaluates pavement through a PCI study every 4-5 years in order to
 - Acquire relevant data about the present-day conditions, to acquire data about the deterioration of the network over time, and to utilize as a primary tool in making capital project decisions on street right of way.

2008 PCI = 75.54 avg.
